

## P&G Pro Line Laundry Equipment

3 Pump bank with spare slot for extra pump.

- Used to pump Tide Downy and Clorox to one commercial laundry machine.
- These pump banks can be used in sequence to send to multiple machines - up to 3 pump banks per set of product buckets.

Signal interceptor.

- Takes signals from the wash machine (24V - 240VAC) when the wash program sends a signal asking for product.
- The interceptor turns the voltage into very low voltage (8V) and sends them to our controller for processing.

Controller.

- Used to store the wash formulas, pump calibrations and other set features of the system.
- The controller tells the pumps, based on this stored information, how long to run to deliver the desired chemical content for each individual wash formula and when.

Standard setup of product buckets and pumps to feed one wash machine.
